

### Average waiting time:

Average waiting time of round robin is relatively higher than other algorithms due to preemption of processes. Remaining algorithms are performing relatively equally good.

Average turn around time:

Turn around time graph is quite similar to waiting time graph due to linear dependency to and number of processes

Response time:

Round robin algorithm has relatively very low response time due to continuous preemption of processes, which gives quick chance to the queued processes. Preemptive shortest job first has kind of a irregular graph due to its preemptive nature.
